

Abstract

A pest inspection system comprising at least one inspection station positioned about a predefined inspection area and a central administrator. In response to a periodic reminder issued by the central administrator, a person manually inspects 5 each inspection station about the predefined inspection area for signs of pest infestation. Each inspection station comprises a housing having a transparent portion on at least one side thereof. The housing is able to receive a pest attractant or food source. The housing also has openings therein to allow a pest to access the area where the pest attractant or food source is able to be received. 10 In this manner, the person can inspect any received pest attractant or food source via the transparent portion of the housing.
